

# Package ‘PIUMA’

May 5, 2026

**Type** Package

**Title** Phenotypes Identification Using Mapper from topological data Analysis

**Version** 1.9.0

**Description** The PIUMA package offers a tidy pipeline of Topological Data Analysis frameworks to identify and characterize communities in high and heterogeneous dimensional data.

**License** GPL-3 + file LICENSE

**Encoding** UTF-8

**LazyData** false

**biocViews** Clustering, GraphAndNetwork, DimensionReduction, Network, Classification

**VignetteBuilder** knitr

**Imports** Hmisc, igraph, patchwork, scales, utils, cluster, umap, tsne, kernlab, vegan, dbscan, grDevices, stats, methods, SummarizedExperiment, ggplot2

**Suggests** BiocStyle, testthat, knitr, rmarkdown, Seurat, SingleCellExperiment, aricode, mclust, viridis, magick, ggrepel, dplyr

**Depends** R (>= 4.3)

**RoxygenNote** 7.3.1

**URL** <https://github.com/BioinfoMonzino/PIUMA>

**BugReports** <https://github.com/BioinfoMonzino/PIUMA/issues>

**git\_url** <https://git.bioconductor.org/packages/PIUMA>

**git\_branch** devel

**git\_last\_commit** c00b5d7

**git\_last\_commit\_date** 2026-04-28

**Repository** Bioconductor 3.24

**Date/Publication** 2026-05-04

**Author** Mattia Chiesa [aut, cre] (ORCID:

PIUMA-package	<i>PIUMA: Phenotypes Identification Using Mapper from topological data Analysis</i>
---------------	---

---

### Description

The PIUMA package offers a tidy pipeline of Topological Data Analysis frameworks to identify and characterize communities in high and heterogeneous dimensional data.

### Author(s)

**Maintainer:** Mattia Chiesa <mattia.chiesa@cardiologicomonzino.it> ([ORCID](#))

Authors:

---

autoClusterMapper	<i>Automatic Clustering of a Mapper Graph by Predicted Geometry (with kNN tie-break)</i>
-------------------	--

---

### Description

Cluster Mapper nodes (`x@graph$igraph`) with a chosen community algorithm or an automatic selection based on predicted graph geometry (`x@graph$predicted`). Assign observations either by k-NN tie-breaking (default) or by pure topological label concatenation.

### Usage

```
autoClusterMapper(
  x,
  method = c("automatic", "fast_greedy", "walktrap", "edge_betweenness", "optimal",
            "label_propagation"),
  k = 5L
)
```

**Arguments**

x	A TDAobj with x@graph\$igraph and x@graph\$predicted\$class set.
method	One of "automatic", "fast_greedy", "walktrap", "edge_betweenness", "optimal", "label_propagation". Default "automatic".
k	Integer >=1 or FALSE. Default 5L. If numeric, use k-NN mean distance to break ties; if FALSE, concatenate topological labels (e.g. "2_8", "1_2_3").

**Details**

In method = "automatic", the algorithm is chosen from the predicted geometry:

SF / CM Use *fast greedy* modularity optimization.

WS Use *Walktrap* (short random walks).

RGG Use *edge betweenness* (bridge detection).

SBM Prefer *optimal* (exact modularity) for small graphs; falls back for larger ones.

ER Use *label propagation* (fast, parameter-free).

Isolated nodes (degree = 0) become singletons with unique labels.

**Value**

The input TDAobj *invisibly*, with x@clustering updated:

nodes\_cluster Data frame with columns node, obs, cluster.

obs\_cluster Data frame with columns obs, cluster.

**Author(s)**

Carlo Leonardi, Mattia Chiesa

**See Also**

[mapperCore](#)

**Examples**

```
data(vascEC_norm)
data(vascEC_meta)
#df_TDA <- cbind(vascEC_meta, vascEC_norm)
#df_TDA <- makeTDAobj(df_TDA, outcomes = c("stage", "zone"))
#df_TDA <- dfToDistance(df_TDA, 'euclidean')
#df_TDA <- dfToProjection(df_TDA, "UMAP", nComp = 2)
#df_TDA <- mapperCore(df_TDA,
#   nBins = 20, overlap = 0.3,
#   mClustNode = 2, clustMeth = "kmeans")
#df_TDA <- jaccardMatrix(df_TDA)
#df_TDA <- setGraph(df_TDA)
#df_TDA <- predict_mapper_class(df_TDA)
#df_TDA <- autoClusterMapper(df_TDA, method = 'walktrap')
```

---

checkNetEntropy      *Compute the Network Entropy*

---

**Description**

This function computes the average of the entropies for each node of a network.

**Usage**

```
checkNetEntropy(outcome_vect)
```

**Arguments**

outcome\_vect      A vector containing the average outcome values for each node of a network.

**Details**

The average of the entropies is related to the amount of information stored in the network.

**Value**

The network entropy using each node of a network.

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini

**See Also**

[makeTDAobj](#), [dfToDistance](#), [dfToProjection](#), [mapperCore](#), [jaccardMatrix](#), [tdaDfEnrichment](#)

**Examples**

```
# use example data:
set.seed(1)
entropy <- checkNetEntropy(round(runif(10), 0))
```

---

checkScaleFreeModel      *Assessment of Scale-Free model fitting*

---

**Description**

This function assesses the fitting to a scale-free net model.

**Usage**

```
checkScaleFreeModel(x, showPlot = FALSE)
```

**Arguments**

`x` A TDAobj object, processed by the [jaccardMatrix](#)  
`showPlot` Whether the plot has to be generated. Default: FALSE

**Details**

The scale-free networks show a high negative correlation between  $k$  and  $p(k)$ .

**Value**

A list containing:

- connectivity of the resulting graph
- the estimated gamma value
- the correlation between degree  $\backslash(k)$  and its distribution  $\backslash(p(k))$ .
- The p-value of the correlation between the  $k$  and the degree distribution  $p(k)$ .
- The correlation between the logarithm (base 10) of  $k$  and the logarithm (base 10) of the degree distribution  $p(k)$ .
- The p-value of the correlation between the logarithm (base 10) of  $k$  and the logarithm (base 10) of the degree distribution  $p(k)$ .
- A composite score reflecting how strongly power-law behavior coexists with graph cohesion, computed as the absolute product between  $\text{cor}(P(k)*k)$  and connectivity

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini, Carlo Leonardi

**See Also**

[makeTDAobj](#), [dfToDistance](#), [dfToProjection](#), [mapperCore](#), [jaccardMatrix](#)

**Examples**

```
## use example data:
data(tda_test_data)
netModel <- checkScaleFreeModel(tda_test_data)
print(netModel)
```

---

dfToDistance

---

*Compute the Distance Matrix from TDAobj*

---

**Description**

This function returns the distance matrix computed by using the Pearson's, Euclidean or Gower distance methods. The distances are computed between the rows of a data.frame in the classical form  $n \times m$ , where  $n$  (rows) are observations and  $m$  (columns) are features.

**Usage**

```
dfToDistance(x, distMethod = c("euclidean", "gower", "pearson"))
```

**Arguments**

- `x` A TDAobj object, generated by [makeTDAobj](#) Rows (n) and columns (m) should be, respectively, observations and features.
- `distMethod` The distance method to calculate the distance matrix. "euclidean", "gower" and "pearson" values are allowed. Default: "euclidean".

**Value**

The starting TDAobj object, in which the computed distance matrix has been added (slot: 'dist\_mat')

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini

**See Also**

[makeTDAobj](#)

**Examples**

```
data(vascEC_norm)
data(vascEC_meta)
df_TDA <- cbind(vascEC_meta, vascEC_norm)
df_TDA <- makeTDAobj(df_TDA, outcomes = c("stage", "zone"))
df_TDA <- dfToDistance(df_TDA, 'euclidean')
```

---

dfToProjection

*Data projection using a Dimensionality Reduction Method*

---

**Description**

This function performs the transformation of data from a high dimensional space into a low dimensional space, wrapping 6 well-known reduction methods; i.e., PCA, KPCA, t-SNE, UMAP, MDS, and Isomap. In the topological data analysis, the identified components are commonly used as lenses.

**Usage**

```
dfToProjection(
  x,
  method = c("PCA", "UMAP", "TSNE", "MDS", "KPCA", "ISOMAP"),
  nComp = 2,
  centerPCA = FALSE,
  scalePCA = FALSE,
  umapNNeigh = 15,
  umapMinDist = 0.1,
  tsnePerpl = 30,
  tsneMaxIter = 300,
  kpcakeKernel = c("rbfdot", "laplacedot", "polydot", "tanhdot", "besseldot", "anovadot",
    "vanilladot", "splinedot"),
```

```

kpcaSigma = 0.1,
kpcaDegree = 1,
isomNNeigh = 5,
showPlot = FALSE,
vectColor = NULL
)

```

### Arguments

x	A TDAobj object, generated by <a href="#">makeTDAobj</a>
method	Name of the dimensionality reduction method to use. "PCA", "UMAP", "TSNE", "MDS", "KPCA" and "isomap" values are allowed. Default is: "PCA".
nComp	The number of components to be computed. Default: 2
centerPCA	Whether the data should be centered before PCA. Default:TRUE
scalePCA	Whether the data should be scaled before PCA. Default:TRUE
umapNNeigh	The number of neighbors for UMAP. Default: 15
umapMinDist	The minimum distance between points for UMAP. Default: 0.1
tsnePerpl	Perplexity argument of t-SNE. Default: 30
tsneMaxIter	The maximum number of iterations for t-SNE. Default: 300
kpcaKernel	The type of kernel for kPCA. "rbfdot", "laplacedot", "polydot", "tanhdot", "bessel-dot", "anovadot", "vanilladot" and "splinedot" are allowed. Default: "polydot".
kpcaSigma	The 'sigma' argument for kPCA. Default: 0.1.
kpcaDegree	The 'degree' argument for kPCA. Default: 1.
isomNNeigh	The number of neighbors for Isomap. Default: 5.
showPlot	Whether the scatter plot of the first two principal components should be shown. Default: TRUE.
vectColor	Vector containing the variable to color the scatter plot Default: NULL.

### Value

The starting TDAobj object, in which the principal components of projected data have been added (slot: 'comp')

### Author(s)

Mattia Chiesa, Laura Ballarini, Luca Piacentini

### See Also

[makeTDAobj](#), [dfToDistance](#)

### Examples

```

data(vascEC_norm)
data(vascEC_meta)
df_TDA <- cbind(vascEC_meta, vascEC_norm)
df_TDA <- makeTDAobj(df_TDA, outcomes = c("stage", "zone"))
df_TDA <- dfToProjection(df_TDA, 'PCA', nComp=2)

```

---

df_test_proj	<i>A dataset to test the <a href="#">dfToProjection</a> and <a href="#">dfToDistance</a> funtions of PIUMA package.</i>
--------------	---

---

**Description**

A dataset to test the [dfToProjection](#) and [dfToDistance](#) funtions of PIUMA package.

**Usage**

```
data(df_test_proj)
```

**Format**

A data frame with 15 rows (cells) and 15 columns (genes).

---

getClusters	<i>Getter method for the 'clustering' slot of a TDAobj object.</i>
-------------	--

---

**Description**

The method to get clusters from the clustering slot

**Usage**

```
getClusters(x)
```

```
## S4 method for signature 'TDAobj'  
getClusters(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a data.frame

**Author(s)**

Carlo Leonardi

**Examples**

```
data(tda_test_data)
```

---

getComp	<i>Getter method for the 'comp' slot of a TDAobj object.</i>
---------	--

---

**Description**

The method to get data from the comp slot

**Usage**

```
getComp(x)
```

```
## S4 method for signature 'TDAobj'  
getComp(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a data.frame with the comp data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

getDfMapper	<i>Getter method for the 'dfMapper' slot of a TDAobj object.</i>
-------------	--

---

**Description**

The method to get data from the dfMapper slot

**Usage**

```
getDfMapper(x)
```

```
## S4 method for signature 'TDAobj'  
getDfMapper(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a data.frame with the dfMapper data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
ex_out <- getDfMapper(tda_test_data)
```

---

getDistMat

*Getter method for the 'dist\_mat' slot of a TDAobj object.*

---

**Description**

The method to get data from the dist\_mat slot

**Usage**

```
getDistMat(x)

## S4 method for signature 'TDAobj'
getDistMat(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a data.frame with the dist\_mat data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
ex_out <- getDistMat(tda_test_data)
```

getGraph

*Getter method for the 'graph' slot of a TDAobj object.*

---

**Description**

The method to get igraph object from the graph slot

**Usage**

```
getGraph(x)
```

```
## S4 method for signature 'TDAobj'  
getGraph(x)
```

**Arguments**

x                    a TDAobj object

**Value**

an igraph object

**Author(s)**

Carlo Leonardi

**Examples**

```
data(tda_test_data)
```

---

getJacc

*Getter method for the 'jacc' slot of a TDAobj object.*

---

**Description**

The method to get data from the jacc slot

**Usage**

```
getJacc(x)
```

```
## S4 method for signature 'TDAobj'  
getJacc(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a matrix with the jacc data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
ex_out <- getJacc(tda_test_data)
```

---

getMetrics

*Getter method for the 'metrics' slot under 'graph' of a TDAobj object.*

---

**Description**

The method to get metrics from the graph slot

**Usage**

```
getMetrics(x)

## S4 method for signature 'TDAobj'
getMetrics(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a vector

**Author(s)**

Carlo Leonardi, Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

getNodeDataMat	<i>Getter method for the 'node_data_mat' slot of a TDAobj object.</i>
----------------	---

---

**Description**

The method to get data from the node\_data\_mat slot

**Usage**

```
getNodeDataMat(x)

## S4 method for signature 'TDAobj'
getNodeDataMat(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a data.frame with the node\_data\_mat data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
ex_out <- getNodeDataMat(tda_test_data)
```

---

getOrigData	<i>Getter method for the 'orig_data' slot of a TDAobj object.</i>
-------------	---

---

**Description**

The method to get data from the orig\_data slot

**Usage**

```
getOrigData(x)

## S4 method for signature 'TDAobj'
getOrigData(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a data.frame with the original data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
ex_out <- getOrigData(tda_test_data)
```

---

getOutcome

*Getter method for the 'outcome' slot of a TDAobj object.*

---

**Description**

The method to get data from the outcome slot

**Usage**

```
getOutcome(x)

## S4 method for signature 'TDAobj'
getOutcome(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a data.frame with the outcome data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
ex_out <- getOutcome(tda_test_data)
```

---

getOutcomeFact                    *Getter method for the 'outcomeFact' slot of a TDAobj object.*

---

**Description**

The method to get data from the outcomeFact slot

**Usage**

```
getOutcomeFact(x)

## S4 method for signature 'TDAobj'
getOutcomeFact(x)
```

**Arguments**

x                                  a TDAobj object

**Value**

a data.frame with the outcomeFact data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
ex_out <- getOutcomeFact(tda_test_data)
```

---

getScaledData                    *Getter method for the 'scaled\_data' slot of a TDAobj object.*

---

**Description**

The method to get data from the scaled\_data slot

**Usage**

```
getScaledData(x)

## S4 method for signature 'TDAobj'
getScaledData(x)
```

**Arguments**

x                                  a TDAobj object

**Value**

a data.frame with the scaled data

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
ex_out <- getScaledData(tda_test_data)
```

---

jaccardMatrix

*Compute the Matrix of Jaccard Indexes*

---

**Description**

This function computes the Jaccard index for each pair of nodes contained in TDAobj, generated by the [mapperCore](#) function. The resulting data.frame can be used to represent data as a network, for instance, in Cytoscape

**Usage**

```
jaccardMatrix(x)
```

**Arguments**

x                    A TDAobj object, processed by the [mapperCore](#) function.

**Details**

The Jaccard index measures the similarity of two nodes A and B. It ranges from 0 to 1. If A and B share no members, their Jaccard index would be 0 (= NA). If A and B share all members, their Jaccard index would be 1. Hence, the higher the index, the more similar the two nodes. If the Jaccard index between A and B is different from NA, it means that an edge exists between A and B. The output matrix of Jaccard indexes can be used as an adjacency matrix. The resulting data.frame can be used to represent data as a network, for instance, in Cytoscape.

**Value**

The starting TDAobj object, in which the matrix of Jaccard indexes, calculated comparing each node of the 'dfMapper' slot, has been added (slot: 'jacc')

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini

**See Also**

[makeTDAobj](#), [dfToDistance](#), [dfToProjection](#), [mapperCore](#)

**Examples**

```
## use example data:
data(tda_test_data)
jacc_mat <- jaccardMatrix(tda_test_data)
```

---

makeTDAobj

---

*Import data and generate the TDAobj object*

---

**Description**

This function import a data.frame and create the object to store all data needed for TDA analysis. In addition, some preliminary preprocess steps are performed; specifically, outcomes variables data will be separated the rest of dataset. The remaining dataset will be also re-scaled (0-1)

**Usage**

```
makeTDAobj(df, outcomes)
```

**Arguments**

df	A data.frame representing a dataset in the classical n x m form. Rows (n) and columns (m) should be, respectively, observations and features.
outcomes	A string or vector of string containing the name of variables that have to be considered 'outcomes'

**Value**

A TDA object containing:

- orig\_data A data.frame of original data (without outcomes)
- scaled\_data A data.frame of re-scaled data (without outcomes)
- outcomeFact A data.frame of original outcomes
- outcome A data.frame of original outcomes converted as numeric
- comp A data.frame containing the components of projected data
- dist\_mat A data.frame containing the computed distance matrix
- dfMapper A data.frame containing the nodes, with their elements, identified by TDA
- jacc A matrix of Jaccard indexes between each pair of dfMapper nodes
- node\_data\_mat A data.frame with the node size and the average value
- graph A list containing the igraph object derived from Jaccard matrix and intermediary objects
- clustering A list containing two data.frames indicating the clustering per node and per rows

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini, Carlo Leonardi

**Examples**

```
## use example data:
data("vascEC_meta")
data("vascEC_norm")
df <- cbind(vascEC_meta, vascEC_norm)
res <- makeTDAobj(df, "zone")
```

---

makeTDAobjFromSE

*Import SummarizedExperiment data and generate the TDAobj object*

---

**Description**

This function import a `SummarizedExperiment` object and create the object to store all data needed for TDA analysis. In addition, some preliminary preprocess steps are performed; specifically, outcomes variables data will be separated the rest of dataset. The remaining dataset will be also re-scaled (0-1)

**Usage**

```
makeTDAobjFromSE(SE, outcomes)
```

**Arguments**

SE	A <code>SummarizedExperiment</code> object
outcomes	A string or vector of string containing the name of variables that have to be considered 'outcomes'

**Value**

A TDA object containing:

- `orig_data` A data.frame of original data (without outcomes)
- `scaled_data` A data.frame of re-scaled data (without outcomes)
- `outcomeFact` A data.frame of original outcomes
- `outcome` A data.frame of original outcomes converted as numeric
- `comp` A data.frame containing the components of projected data
- `dist_mat` A data.frame containing the computed distance matrix
- `dfMapper` A data.frame containing the nodes, with their elements, identified by TDA
- `jacc` A matrix of Jaccard indexes between each pair of `dfMapper` nodes
- `node_data_mat` A data.frame with the node size and the average value
- `graph` A list containing the `igraph` object derived from Jaccard matrix and intermediary objects
- `clustering` A list containing two data.frames indicating the clustering per node and per rows

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini, Carlo Leonardi

## Examples

```
## use example data:
data("vascEC_meta")
data("vascEC_norm")
suppressMessages(library(SummarizedExperiment))
dataSE <- SummarizedExperiment(
  assays = as.matrix(t(vascEC_norm)),
  colData = as.data.frame(vascEC_meta)
)
res <- makeTDAobjFromSE(dataSE, "zone")
```

---

 mapperCore

---

*Implement the TDA Mapper algorithm on TDAobj*

---

## Description

This is a comprehensive function permitting to perform the core TDA Mapper algorithm with 2D lenses. It allow setting several types of clustering methods. There is no restriction to nBins and mClustNode, so the user can tune those for parameter search.

## Usage

```
mapperCore(
  x,
  nBins = 15,
  overlap = 0.4,
  mClustNode = 2,
  remEmptyNode = TRUE,
  clustMeth = c("kmeans", "HR", "DBSCAN", "OPTICS"),
  HRMethod = c("average", "complete")
)
```

## Arguments

x	A TDAobj object, processed by the <a href="#">dfToDistance</a> and <a href="#">dfToProjection</a> functions.
nBins	The number of bins (i.e. the resolution of the cover). Default: 15.
overlap	The overlap between bins (i.e.the gain of the cover). Default: 0.4.
mClustNode	The number of clusters in each overlapping bin. Default: 2
remEmptyNode	A logical value to remove or not the empty nodes from the resulting data.frame. Default: TRUE.
clustMeth	The clustering algorithm."HR", "kmeans", "DBSCAN", and "OPTICS" are allowed. Default: "kmeans".
HRMethod	The name of the linkage criterion (when clustMeth="HR"). "average" and "complete" values are allowed. Default: "average".

**Value**

The starting TDAobj object, in which the result of mapper algorithm (inferred nodes with their elements) has been added (slot: 'dfMapper')

A data.frame containing the clusters, with their elements, identified by TDA .

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini, Carlo Leonardi

**See Also**

[makeTDAobj](#), [dfToDistance](#), [dfToProjection](#)

**Examples**

```
# use example data:
data(vascEC_norm)
data(vascEC_meta)
df_TDA <- cbind(vascEC_meta, vascEC_norm)
df_TDA <- makeTDAobj(df_TDA, outcomes = c("stage", "zone"))
df_TDA <- dfToDistance(df_TDA, 'euclidean')

PIUMA

*PIUMA: Phenotypes Identification Using Mapper from topological data Analysis*

---

**Description**

The application of unsupervised learning methodologies could help the identification of specific phenotypes in huge heterogeneous cohorts, such as clinical or -omics data. Among them, the Topological Data Analysis (TDA) is a rapidly growing field that combines concepts from algebraic topology and computational geometry to analyze and extract meaningful information from complex and high-dimensional data sets. Moreover, TDA is a robust and effective methodology, able to preserve the intrinsic characteristics of data and the mutual relations among observations, depicting complex data in a graph-based representation. Indeed, building topological models as networks, TDA allows complex diseases to be inspected in a continuous space, where subjects can fluctuate over the graph, sharing, at the same time, more than one adjacent node of the network. Overall, TDA offers a powerful set of tools to capture the underlying topological features of data, revealing essential patterns and relationships that might be hidden from traditional statistical techniques. The PIUMA package (Phenotypes Identification Using Mapper from topological data Analysis) allows implementing all the main steps of a Topological Data Analysis. PIUMA is the italian word meaning 'feather'.

**Details**

See the package vignette, by typing `vignette("PIUMA")` to discover all the functions.

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini

---

predict\_mapper\_class *Predict Mapper Graph Geometry (lightweight)*

---

**Description**

Infer a geometry label for `x@graph$igraph` using fast heuristics. Writes only `x@graph$predicted$class` (one of `c("SF", "RGG", "WS", "ER", "SBM", "CM")`).

#' @details Heuristics (hierarchical decision):

- **SF (relaxed)**: rely on `checkScaleFreeModel(x)`. Declare scale-free if at least one of the following holds:  $|\text{cor}(\log k, \log p_k)| \geq 0.55$ ,  $|\text{cor}(k, p_k)| \geq 0.70$ ,  $1.6 \leq \gamma \leq 3.6$ , or  $\text{Connectivity} \geq 0.40$ ; alternatively accept SF if the product score  $|\text{cor}(\log k, \log p_k)| * \text{Connectivity} \geq 0.2$ .
- **WS**: small-world index  $\sigma > 1.2$  with  $C/C_{ER} \geq 3$  and  $L/L_{ER} \leq 1.2$ .
- **RGG**: very high clustering vs ER ( $C/C_{ER} \geq 5$ ), longer paths ( $L/L_{ER} \geq 1.3$ ), and positive degree assortativity ( $r \geq 0.10$ ).
- **ER**: Poisson-like degree dispersion  $\text{VMR} = \text{var}(k)/\text{mean}(k) \sim 1$  (within 30%),  $|C - p| \leq 0.05$ ,  $|r| \leq 0.05$ , and  $0.8 \leq \sigma \leq 1.2$ .
- **SBM**: strong modular structure,  $Q \geq 0.40$  with  $\geq 3$  communities.
- **CM**: heterogeneous degrees ( $\text{var}(k)/\text{mean}(k) > 2$ ) with clustering close to ER ( $|C - C_{ER}| \leq 0.05$ ); otherwise use a sigma-based fallback (WS if  $\sigma > 1.2$ , else ER).

The function sets only `x@graph$predicted`. It is intentionally lightweight for fast computation.

**Usage**

```
predict_mapper_class(x, verbose = FALSE)
```

**Arguments**

<code>x</code>	A TDAobj with <code>x@graph\$igraph</code> set.
<code>verbose</code>	Logical; print the chosen label. Default FALSE.

**Value**

The input TDAobj with `x@graph$predicted` set.

**Author(s)**

Carlo Leonardi, Mattia Chiesa

**Examples**

```
data(tda_test_data)
#tda_test_data <- predict_mapper_class(tda_test_data)
```

---

setComp	<i>Setter method for the 'comp' slot of a TDAobj object.</i>
---------	--

---

**Description**

The method to set the comp slot

**Usage**

```
setComp(x, y)

## S4 method for signature 'TDAobj'
setComp(x, y)
```

**Arguments**

x	a TDAobj object
y	a data.frame with the comp data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

setDfMapper	<i>Setter method for the 'dfMapper' slot of a TDAobj object.</i>
-------------	--

---

**Description**

The method to set the dfMapper slot

**Usage**

```
setDfMapper(x, y)

## S4 method for signature 'TDAobj'
setDfMapper(x, y)
```

**Arguments**

x                    a TDAobj object  
y                    a data.frame with the dfMapper data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

setDistMat	<i>Setter method for the 'dist_mat' slot of a TDAobj object.</i>
------------	--

---

**Description**

The method to set the dist\_mat slot

**Usage**

```
setDistMat(x, y)  
  
## S4 method for signature 'TDAobj'  
setDistMat(x, y)
```

**Arguments**

x                    a TDAobj object  
y                    a data.frame with the dist\_mat data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

setGraph	<i>Setter method for the 'graph' slot of a TDAobj object.</i>
----------	---

---

**Description**

The method to set igraph object to the graph slot

**Usage**

```
setGraph(x)
```

```
## S4 method for signature 'TDAobj'  
setGraph(x)
```

**Arguments**

x                    a TDAobj object

**Value**

a TDAobj object

**Author(s)**

Carlo Leonardi

**Examples**

```
data(tda_test_data)
```

---

setJacc	<i>Setter method for the 'jacc' slot of a TDAobj object.</i>
---------	--

---

**Description**

The method to set the jacc slot

**Usage**

```
setJacc(x, y)
```

```
## S4 method for signature 'TDAobj'  
setJacc(x, y)
```

**Arguments**

x                    a TDAobj object  
y                    a matrix with the jacc data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

setNodeDataMat

*Setter method for the 'node\_data\_mat' slot of a TDAobj object.*

---

**Description**

The method to set the node\_data\_mat slot

**Usage**

```
setNodeDataMat(x, y)
```

```
## S4 method for signature 'TDAobj'  
setNodeDataMat(x, y)
```

**Arguments**

x                    a TDAobj object  
y                    a data.frame with the node\_data\_mat data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

setOrigData	<i>Setter method for the 'orig_data' slot of a TDAobj object.</i>
-------------	---

---

**Description**

The method to set the orig\_data slot

**Usage**

```
setOrigData(x, y)
```

```
## S4 method for signature 'TDAobj'  
setOrigData(x, y)
```

**Arguments**

x	a TDAobj object
y	a data.frame with the original data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

setOutcome	<i>Setter method for the 'outcome' slot of a TDAobj object.</i>
------------	---

---

**Description**

The method to set the outcome slot

**Usage**

```
setOutcome(x, y)
```

```
## S4 method for signature 'TDAobj'  
setOutcome(x, y)
```

**Arguments**

x	a TDAobj object
y	a data.frame with the outcome data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

setOutcomeFact	<i>Setter method for the 'outcomeFact' slot of a TDAobj object.</i>
----------------	---

---

**Description**

The method to set the outcomeFact slot

**Usage**

```
setOutcomeFact(x, y)  
  
## S4 method for signature 'TDAobj'  
setOutcomeFact(x, y)
```

**Arguments**

x	a TDAobj object
y	a data.frame with the outcomeFact data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

setScaledData	<i>Setter method for the 'scaled_data' slot of a TDAobj object.</i>
---------------	---

---

**Description**

The method to set the scaled\_data slot

**Usage**

```
setScaledData(x, y)

## S4 method for signature 'TDAobj'
setScaledData(x, y)
```

**Arguments**

x	a TDAobj object
y	a data.frame with the scaled data

**Value**

a TDAobj object

**Author(s)**

Mattia Chiesa

**Examples**

```
data(tda_test_data)
```

---

tdaDfEnrichment	<i>Add information to TDAobj</i>
-----------------	----------------------------------

---

**Description**

This function computes the average value of additional features provided by the user and calculate the size for each node of 'dfMapper' slot

**Usage**

```
tdaDfEnrichment(x, df)
```

**Arguments**

x	A TDAobj object, processed by the <a href="#">mapperCore</a> function.
df	A data.frame with scaled values in the classical n x m form: rows (n) and columns (m) must be observations and features, respectively.

**Value**

The starting TDAobj object, in which the a data.frame with additional information for each node has been added (slot: 'node\_data\_mat')

**Author(s)**

Mattia Chiesa, Laura Ballarini, Luca Piacentini

**See Also**

[makeTDAobj](#), [dfToDistance](#), [dfToProjection](#), [mapperCore](#), [jaccardMatrix](#)

**Examples**

```
## use example data:
data(tda_test_data)
data(df_test_proj)
enrich_mat_tda <- tdaDfEnrichment(tda_test_data, df_test_proj)
```

---

TDAobj-class

*The object 'TDAobj'*

---

**Description**

The TDA object for storing TDA data

**Value**

TDAobj class `showClass("TDAobj")`

**Slots**

`orig_data` A data.frame of original data (without outcomes)  
`scaled_data` A data.frame of re-scaled data (without outcomes)  
`outcomeFact` A data.frame of original outcomes  
`outcome` A data.frame of original outcomes converted as numeric  
`comp` A data.frame containing the components of projected data  
`dist_mat` A data.frame containing the computed distance matrix  
`dfMapper` A data.frame containing the nodes, with their elements, identified by TDA  
`jacc` A matrix of Jaccard indexes between each pair of dfMapper nodes  
`node_data_mat` A data.frame with the node size and the average value of each feature  
`graph` A list containing the igraph object of your Jaccard matrix, metrics and intermediary objects  
`clustering` A data.frame containing clusters from TDA on nodes and cells

---

tda_test_data	<i>A TDAobj to test the PIUMA package.</i>
---------------	--

---

**Description**

A TDAobj with data in all slots for testing.

**Usage**

```
data(tda_test_data)
```

**Format**

A TDAobj.

---

vascEC_meta	<i>Example datasets for PIUMA package</i>
-------------	---

---

**Description**

We tested PIUMA on a subset of the single-cell RNA Sequencing dataset (GSE:GSE193346 generated and published by Feng et al. (2022) on Nature Communication to demonstrate that distinct transcriptional profiles are present in specific cell types of each heart chambers, which were attributed to have roles in cardiac development. In this tutorial, our aim will be to exploit PIUMA for identifying sub-population of vascular endothelial cells, which can be associated with specific heart developmental stages. The original dataset consisted of three layers of heterogeneity: cell type, stage and zone (i.e., heart chamber). Our testing dataset was obtained by subsetting vascular endothelial cells (cell type) by Seurat object, extracting raw counts and metadata. Thus, we filtered low expressed genes and normalized data by DaMiRseq

**Usage**

```
data(vascEC_meta)
```

**Format**

A data frame with 1180 rows (cells) and 2 columns (outcomes).

---

vascEC\_norm
